rxTools

-with Pasta-
-For V3.0-

Quick Start Guide
(First Time Install)

1.

Run: "rxTools\release\Tools\cdn_firm.py"

Windows Users:

- you need to install ‘python’ first.
- **https://www.python.org/downloads/**
- double click “cdn_firm.py”

GNU/Linux Users:

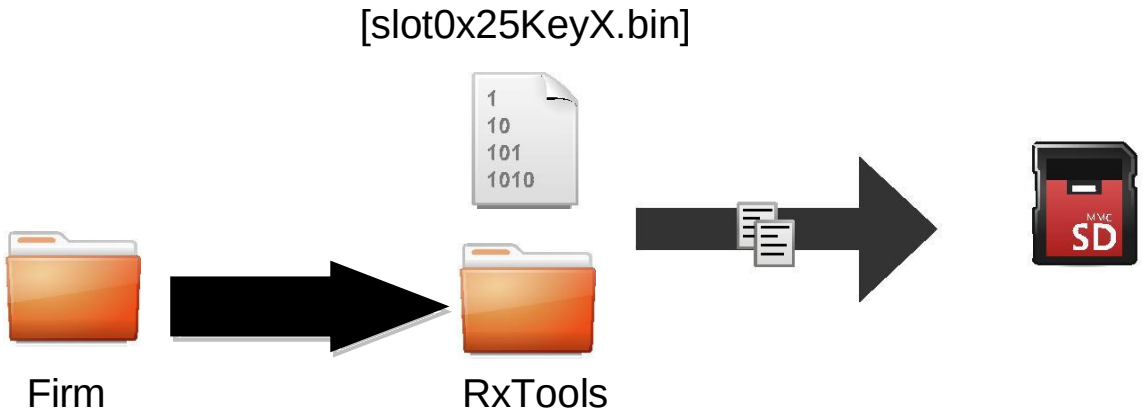
- in terminal type: “python” (WITHOUT QUOTES)
- follow by a single space, then drag&drop “cdn_firm.py”
- press enter. (allow to complete download)

2.

- Copy the ‘firm’ folder generated in step **one** to: “release\rxTools”

- Now copy “rxTools” folder to the **root** of your SD card.
- Along with “slot0x25KeyX.bin”

(NOTE: firmware versions higher than 8.0, do not need “slot0x25KeyX.bin”)



NOTE: If using a New 3DS, you also need the encrypted “firmware.bin” used by previous versions of Cakehax. Rename to: 000401382000002.bin and place in Firm folder.
MD5 is: B99ADF0ADB279712367C06EB83BA9AE6

3.

To Launch:

- Copy “rxTools.3dsx”.
- From “\release\ninjhax\rxTools” to **root** of SD.
- Rename it to “boot.3dsx”

- load any exploit, such as:

RxTools (loads using code.bin)
https://dukesrg.github.io/?rxTools/sys/code.bin

themehax/homemenuhax (if previously setup) (loads using boot.3dsx at boot)
N/A

browserhax (homebrew launcher). (loads using boot.3dsx in browser)
http://yls8.mtheall.com/3dsbrowserhax_auto.php

4.

Troubleshooting:

Q: browser isn’t working properly.
A: open browser without loading anything, go to settings (within browser app), scroll right down and select “clear all save data”. Open browser again (to create initial data). Then re-try. Sometimes a restart is required after initial data has been created, otherwise browser will continue to crash.

Q: cdn_firm.py won’t download ‘firm’.
A: files in the ‘firm’ folder come from nintendo’s servers. It’s possible you may have your internet connection set to block them to prevent updates? In which case remove any internet connection mods (DNS redirects etc) and try again.

Q: I simply can’t be bothered to type those lengthy websites into my 3ds.

A: Use the QR codes then, duh.
